What is chronic venous insufficiency (CVI)?

Chronic venous insufficiency “CVI” is the inability of the veins to carry blood back toward the heart.

How does CVI appear?

CVI may appear as:

- Varicose veins
- Hemorrhoids
- Edema.

What Causes CVI:

CVI is usually attributed to either valve damage within the leg veins, or deep vein thrombosis blockage, which results in blood leakage and pooling in the legs and feet.

Are there any symptoms from which I can know I have CVI?

Usually symptoms are

- Swollen legs.
- Varicose veins.
- A feeling of heaviness.
- Pain.
- Tiredness.
- Itching.
- Tension.
- Cramps in the calves.

Does CVI just appear?

Stage 1
Swelling and
changes in skin
pigmentation.

Stage 2
Swelling,
changes in skin
pigmentation, and
dermatitis.

Stage 3
Swelling, changes in
skin pigmentation,
varicose veins &
ulcers.

No, CVI takes time
to appear and
goes through 3
stages of severity:

How can you manage CVI?

1. Compression stockings to encourage blood flow up the leg.
2. Surgical vein stripping (used when compression therapy fail).
3. Sclerotherapy, or laser surgery procedures (cosmetic solutions for varicose veins but can't prevent the appearance of new ones.)
4. Venotonic products

Repaiona®
